Java Socket Programming

61FIT3NPR -Network Programming

Faculty of Information Technology
Hanoi University
Fall 2020

Java Sockets Programming

- The package java.net provides support for sockets programming (and more).
- Typically you import everything defined in this package with:

```
import java.net.*;
```

Classes

InetAddress

Socket

ServerSocket

DatagramSocket

DatagramPacket

InetAddress class

- static methods you can use to create new InetAddress objects.
  - getByName(String host)
  - getAllByName(String host)
  - getLocalHost()

```
InetAddress x = InetAddress.getByName(
                                    "cse.unr.edu");
```

- Throws **UnknownHostException**

```
try {

  InetAddress a = InetAddress.getByName(hostname);
  System.out.println(hostname + ":" + a.getHostAddress());

} catch (UnknownHostException e) {

      System.out.println("No address found for " + hostname);

}
```

Socket class

- Corresponds to active TCP sockets only!
  - client sockets
  - socket returned by accept();
- Passive sockets are supported by a different class:
  - ServerSocket
- UDP sockets are supported by
  - DatagramSocket

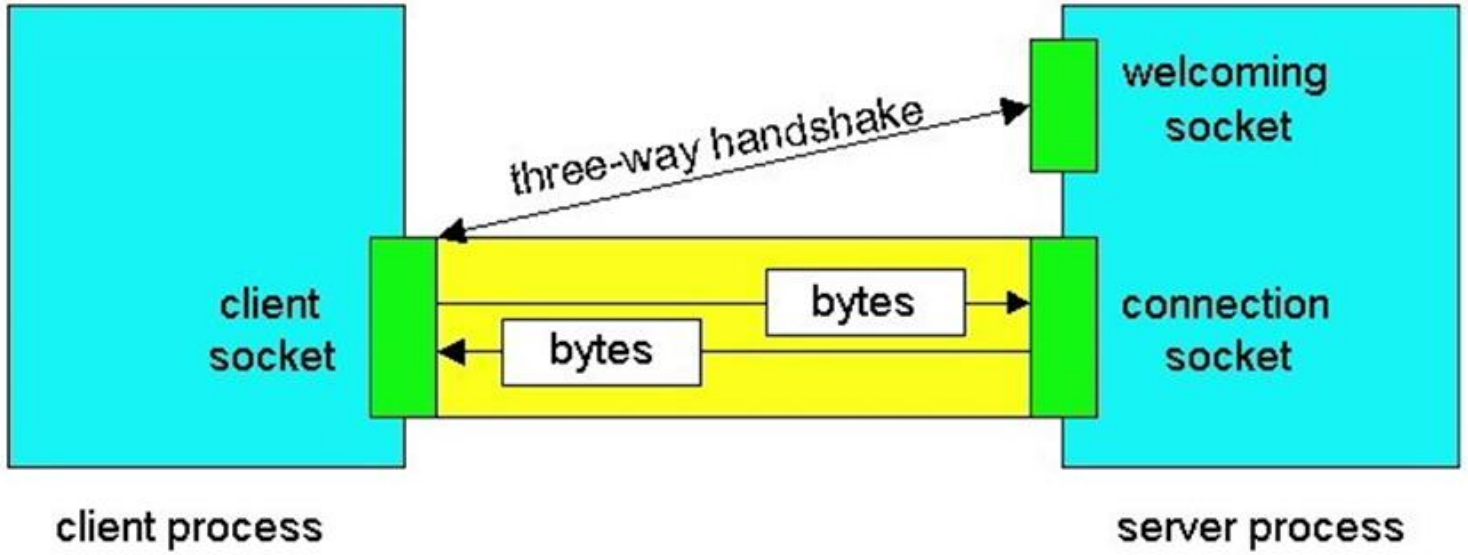
JAVA TCP Sockets (Client Socket)

- java.net.Socket
  - Implements client sockets (also called just "sockets").
  - An endpoint for communication between two machines.
  - Constructor and Methods
    - ***Socket(String host, int port):*** Creates a stream socket and connects it to the specified port number on the named host.
    - ***InputStream getInputStream()***
    - ***OutputStream getOutputStream()***
    - ***close()***

ServerSocket

- java.net.ServerSocket
  - Implements server sockets.
  - Waits for requests to come in over the network.
  - Performs some operation based on the request.
  - Constructor and Methods
    - ServerSocket(int port)
    - Socket Accept(): Listens for a connection to be made to this socket and accepts it. This method blocks until a connection is made.

Socket
s



Client socket, welcoming socket (passive) and connection socket (active)

Socket Constructors

- Constructor creates a TCP connection to a named TCP server.
  - There are a number of constructors:

```
Socket(InetAddress server, int port);

Socket(InetAddress server, int port,
       InetAddress local, int localport);

Socket(String hostname, int port);
```

Socket Methods

```
void close();
InetAddress getInetAddress();
InetAddress getLocalAddress();
InputStream getInputStream();
OutputStream getOutputStream();
```

- Lots more (setting/getting socket options, partial close, etc.)

Socket I/O

- Socket I/O is based on the Java I/O support
  - in the package `java.io`
- InputStream and OutputStream are abstract classes
  - common operations defined for all kinds of InputStreams, OutputStreams…

InputStream Basics

```
// reads some number of bytes and
// puts in buffer array b
int read(byte[] b);

// reads up to len bytes
int read(byte[] b, int off, int len);
```

Both methods can throw **`IOException`**.

Both return -1 on EOF.

OutputStream Basics

```
// writes b.length bytes
void write(byte[] b);

// writes len bytes starting
// at offset off
void write(byte[] b, int off, int len);
```

Both methods can throw **IOException**.

ServerSocket Class (TCP Passive Socket)

- Constructors:

```
ServerSocket(int port);

ServerSocket(int port, int backlog);

ServerSocket(int port, int backlog,
             InetAddress bindAddr);
```

ServerSocket Methods

```
Socket accept();

void close();

InetAddress getInetAddress();

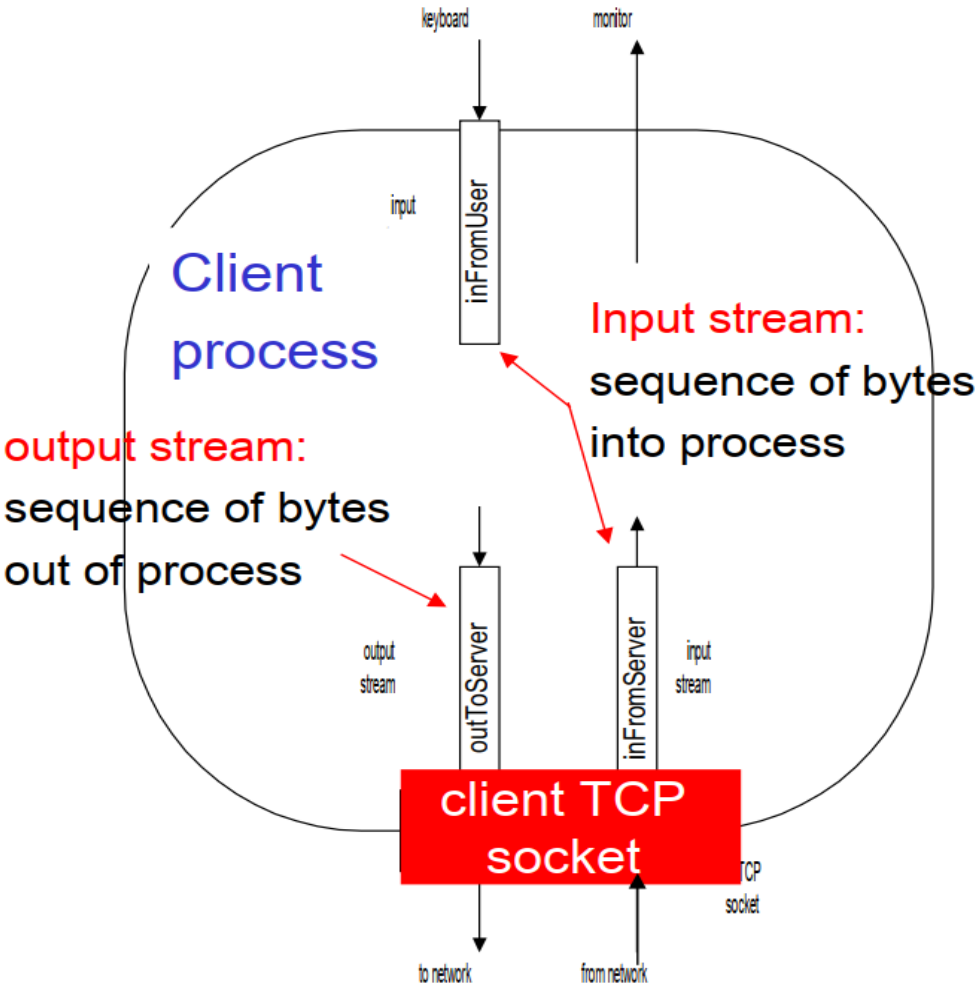
int getLocalPort();
```

throw **IOException, SecurityException**

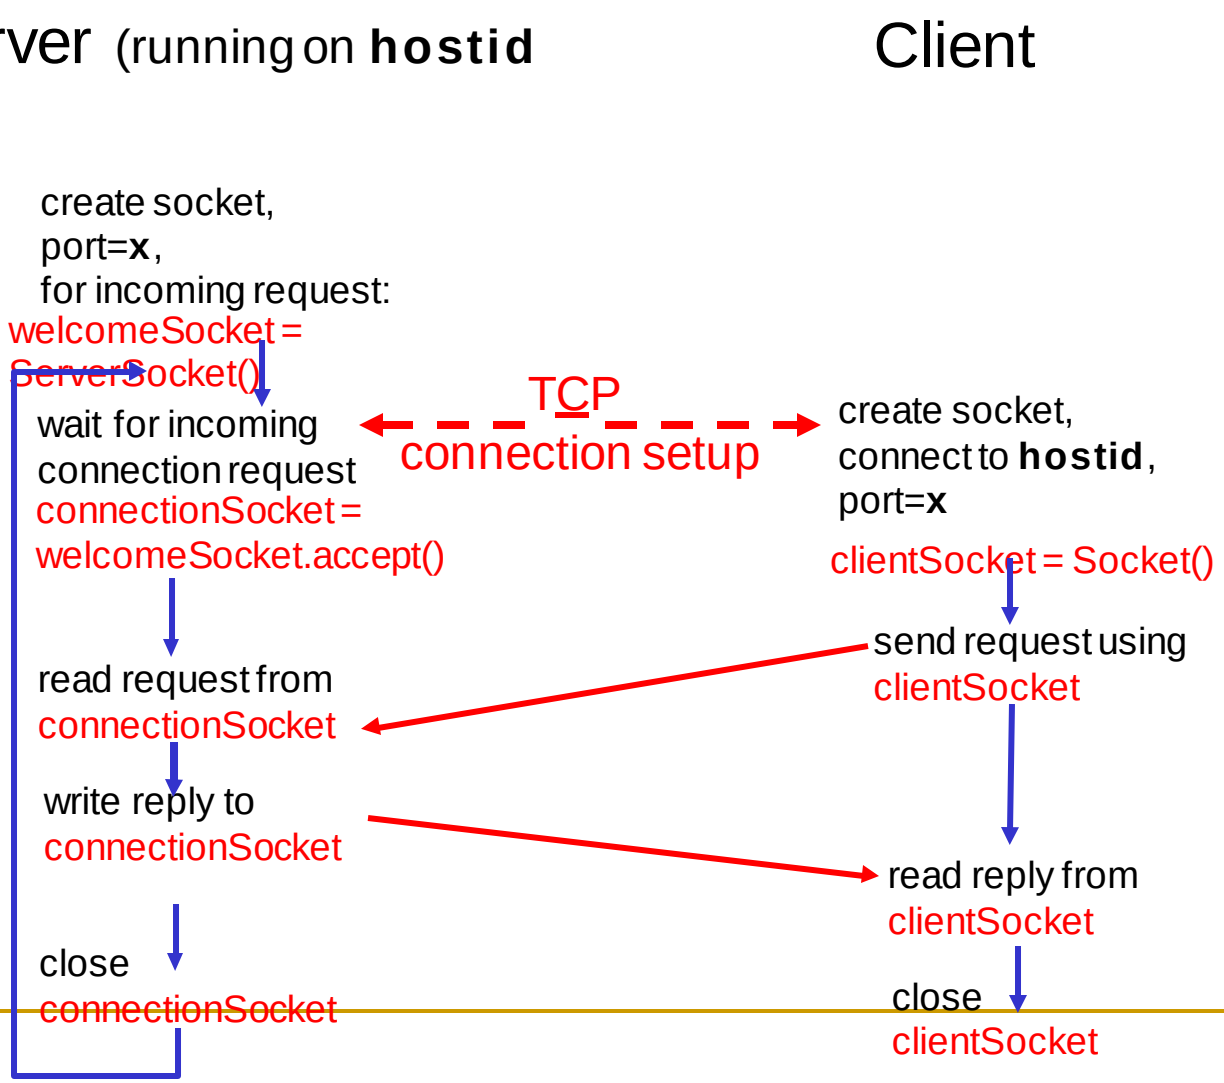
Socket programming with TCP

Example client-server app:

- client reads line from standard input (**inFrom User** stream) , sends to server via socket (**outTo Server** stream)
- server reads line from socket
- server converts line to uppercase, sends back to client
- client reads, prints modified line from socket (**inFrom Server** stream)



Client/server socket interaction: TCP



Sample Echo Server

TCPEchoServer.java
And TCPClient.java

Save both files, compile and run on separate terminal.
First TCPEchoServer and then TCPClient

Based on code from:

TCP/IP Sockets in Java

TCPEchoServer.java

```
import java.io.*;
import java.net.*;

class TCPServer {
public static void main(String argv[]) throws Exception {
String clientSentence;
String capitalizedSentence;
ServerSocket welcomeSocket = new ServerSocket(6789);
System.out.println("Server is waiting to accept user... ");

while(true) {

Socket connectionSocket = welcomeSocket.accept();
        System.out.println("Accept a client!");
```

```
        BufferedReader inFromClient = new BufferedReader(new
InputStreamReader(connectionSocket.getInputStream()));
        DataOutputStream outToClient = new
DataOutputStream(connectionSocket.getOutputStream());
        clientSentence = inFromClient.readLine();
        capitalizedSentence = clientSentence.toUpperCase() +
"\n";

        outToClient.writeBytes(capitalizedSentence);
    }
}
}
```

TCPClient.java

```
import java.io.*;
import java.net.*;

public class TCPClient {
	public static void main(String argv[]) throws Exception {
		String sentence;
		String modifiedSentence;
		BufferedReader inFromUser = new BufferedReader(new
InputStreamReader(System.in));
		while(true) {
			System.out.println("Please enter your
message");
			Socket clientSocket = new
Socket("localhost", 6789);
			DataOutputStream outToServer = new
DataOutputStream  (clientSocket.getOutputStream());
```

```
BufferedReader inFromServer = new BufferedReader(new
InputStreamReader(clientSocket.getInputStream()));

                    sentence = inFromUser.readLine();
                    outToServer.writeBytes(sentence +
'\n');
                    modifiedSentence =
inFromServer.readLine();
                    System.out.println("FROM SERVER: " +
modifiedSentence);
                    //clientSocket.close();
                }
        }
}
```

UDP Sockets

- `DatagramSocket` class
- `DatagramPacket` class needed to specify the payload
  - incoming or outgoing

Socket Programming with UDP

- UDP
  - Connectionless and unreliable service.
  - There isn't an initial handshaking phase.
  - Transmitted data may be received out of order, or lost.

- Socket Programming with UDP
  - No need for a welcoming socket.
  - No streams are attached to the sockets.
  - The sending hosts creates "packets" by attaching the IP destination address and port number to each batch of bytes.
  - The receiving process must unravel to received packet to obtain the packet's information bytes.

JAVA UDP Sockets

- In Package java.net
  - java.net.DatagramSocket
    - A socket for sending and receiving datagram packets.
    - Constructor and Methods
      - DatagramSocket(int port): Constructs a datagram socket and binds it to the specified port on the local host machine.
      - void receive (DatagramPacket p)
      - void send (DatagramPacket p)
      - void close()

DatagramSocket Constructors

```
DatagramSocket();

DatagramSocket(int port);

DatagramSocket(int port, InetAddress a);
```

All can throw SocketException or SecurityException

Datagram Methods

```
void connect(InetAddress, int port);

void close();

void receive(DatagramPacket p);

void send(DatagramPacket p);
```

Lots more!

DatagramPacket

- Contain the payload
  - (a byte array, length of byte array, InetAddress, port)
- Can also be used to specify the destination address
  - when not using connected mode UDP

DatagramPacket Constructors

For receiving:

```
DatagramPacket( byte[] buf, int len);
```

For sending:

```
DatagramPacket( byte[] buf, int len
                InetAddress a, int port);
```

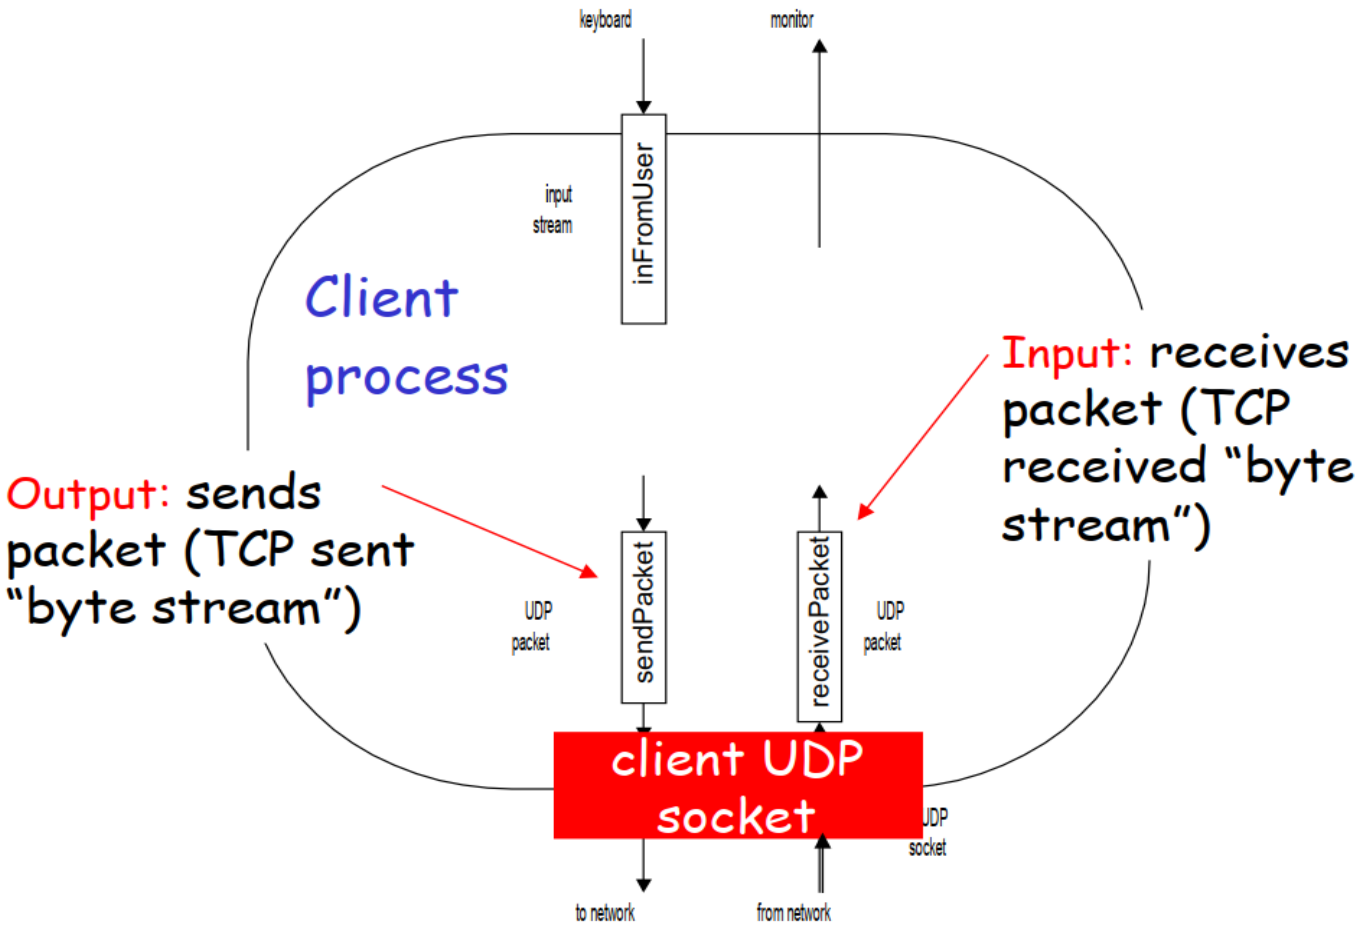
DatagramPacket methods

```
byte[] getData();
void setData(byte[] buf);

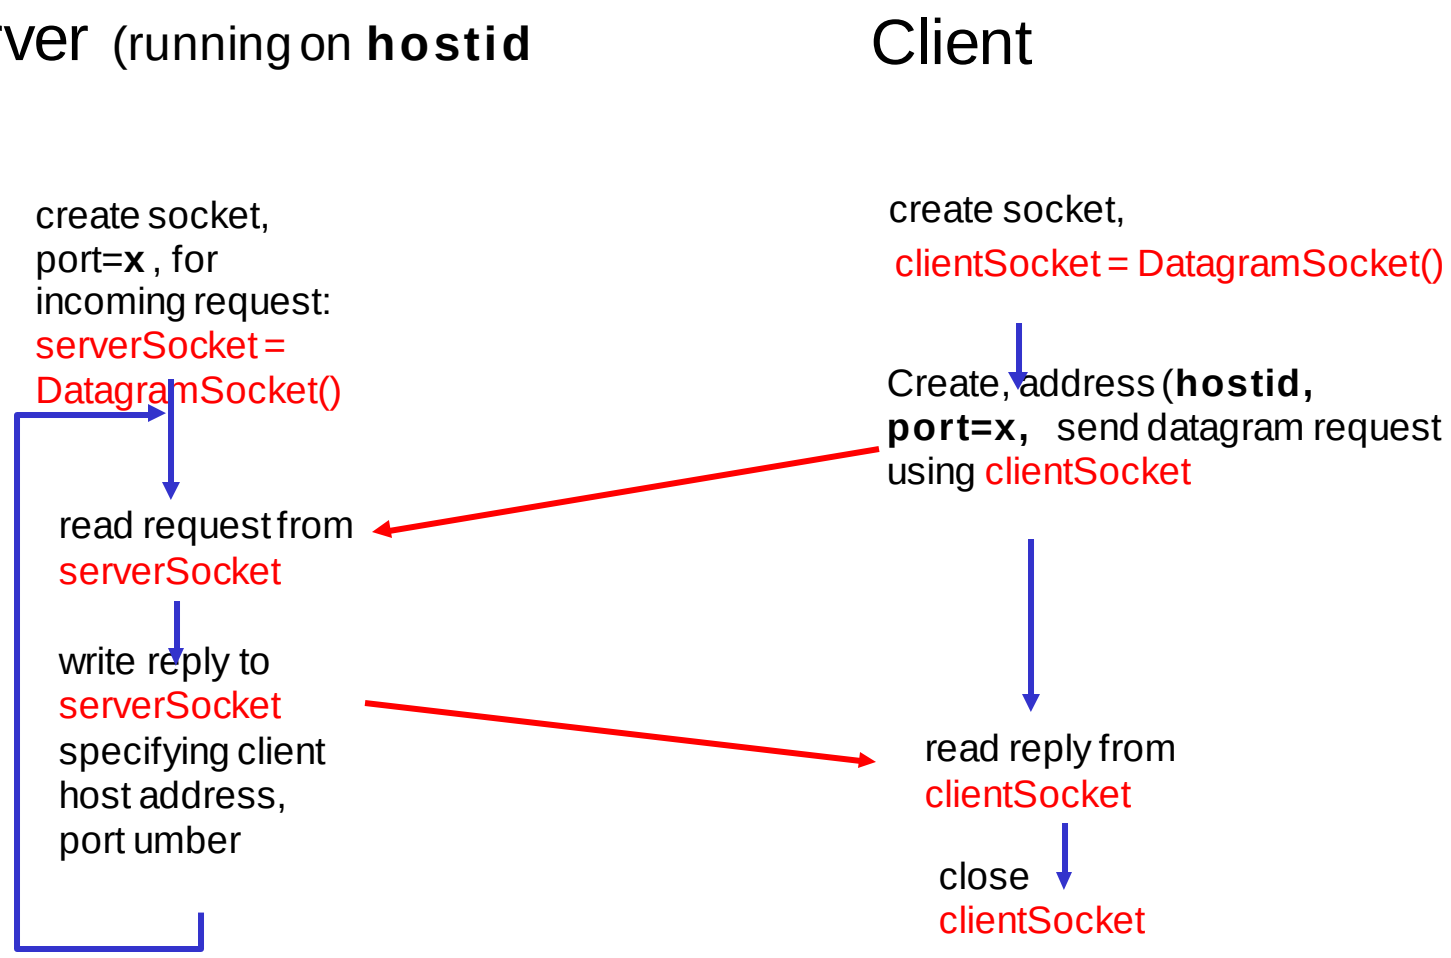
void setAddress(InetAddress a);
void setPort(int port);

InetAddress getAddress();
int getPort();
```

Example: Java client (UDP)



Client/server socket interaction: UDP



Sample UDP code

UDPEchoServer.java

Simple UDP Echo server.

Test using nc as the client (netcat):

```
> nc -u hostname port
```

UDPEchoServer.java

```
import java.io.*;
import java.net.*;

class UDPEchoServer {
	public static void main(String args[]) throws Exception {
		int port = 9876;
		DatagramSocket serverSocket = new
DatagramSocket(port);

		byte[] receiveData = new byte[1024];
		byte[] sendData     = new byte[1024];
```

```
            while(true) {
                    DatagramPacket receivePacket = new
DatagramPacket (receiveData, receiveData.length);
                    serverSocket.receive(receivePacket);
                    String sentence = new
String(receivePacket.getData());
                    InetAddress IPAddress =
receivePacket.getAddress();
                    int clientPort = receivePacket.getPort();
                    String capitalizedSentence =
sentence.toUpperCase();
                    sendData = capitalizedSentence.getBytes();
                    DatagramPacket sendPacket = new
DatagramPacket  (sendData, sendData.length, IPAddress, clientPort);
                    serverSocket.send(sendPacket);

            }
        }
}
```

UDPClient.java

```
import java.io.*;
import java.net.*;

public class UDPClient {
	public static void main(String args[]) throws Exception {
		BufferedReader inFromUser = new BufferedReader(new
InputStreamReader (System.in));
		int port = 9876;
		DatagramSocket clientSocket = new
DatagramSocket();
		InetAddress IPAddress =
InetAddress.getByName("localhost");

		byte[] sendData = new byte[1024];
		byte[] receiveData = new byte[1024];
```

```
while(true) {
                    System.out.println("Please enter your message");
                    String sentence = inFromUser.readLine();
                    sendData = sentence.getBytes();
                    DatagramPacket sendPacket = new DatagramPacket
(sendData,  sendData.length, IPAddress, port);
                    clientSocket.send(sendPacket);
                    DatagramPacket receivePacket = new DatagramPacket
(receiveData, receiveData.length);
                    clientSocket.receive(receivePacket);
                    String modifiedSentence = new
String(receivePacket.getData());
                    System.out.println("FROM SERVER:" +
modifiedSentence);
                    //clientSocket.close();
                }

        }
}
```

Socket functional calls

- socket (): Create a socket
- bind(): bind a socket to a local IP address and port #

- listen(): passively waiting for connections
- connect(): initiating connection to another socket
- accept(): accept a new connection

- Write(): write data to a socket
- Read(): read data from a socket
- sendto(): send a datagram to another UDP socket
- recvfrom(): read a datagram from a UDP socket

- close(): close a socket (tear down the connection)

Java URL Class

- Represents a Uniform Resource Locator
  - scheme (protocol)
  - hostname
  - port
  - path
  - query string

Parsing

- You can use a URL object as a *parser*:

```
URL u = new URL("http://www.cs.unr.edu/");

System.out.println("Proto:" + u.getProtocol());

System.out.println("File:" + u.getFile());
```

URL construction

- You can also build a URL by setting each part individually:

```
URL u = new URL("http",
                www.cs.unr.edu,80,"/~mgunes/");

System.out.println("URL:" + u.toExternalForm());

System.out.println("URL: " + u);
```

Retrieving URL contents

- URL objects can retrieve the documents they refer to!
  - actually this depends on the protocol part of the URL.
  - HTTP is supported
  - File is supported ("file://c:\foo.html")
  - You can get "Protocol Handlers" for other protocols.

- There are a number of ways to do this:

```
Object getContent();

InputStream openStream();

URLConnection openConnection();
```

Getting Header Information

- There are methods that return information extracted from response headers:

```
String getContentType();

String getContentLength();

long getLastModified();
```

URLConnection

- Represents the connection (not the URL itself).
- More control than URL
  - can write to the connection (send POST data).
  - can set request headers.
- Closely tied to HTTP
